## 1. C++

### 1.1. Optimizations

```
#pragma GCC optimize("Ofast, unroll-loops")
#pragma GCC target("avx2,bmi,bmi2,lzcnt,popcnt,tune=native")
```

### 1.2. Hash function

```
static uint64_t splitmix64(uint64_t x)
{x+=0x9e3779b97f4a7c15;x=(x^(x>>30))*0xb58476d1ce4e5b9;
x=(x^(x>>27))*0x94d049bb13311leb;
return x^(x>>31);}
struct custom_hash {size_t operator()(uint64_t x) const {
    static const uint64_t FIXED_RANDOM =
chrono::steady_clock::now().time_since_epoch().count();
const long long mod=998244353;
//1000000007
long long modpow(long long n, long long m){long long
res=1;while(m){if(m&1)res=res*n%mod;n=n*n%mod;m>>=1;}return res;}
```

### 1.3. Bitset

```
bitset<10> bb("1010000000"); // reverse order constructor
cout << bb.count() << "\n"; // 2
cout << bb._Find_first() << "\n"; // 7
bb[0] = 1;
cout << bb._Find_first() << "\n"; // 0
```

### 1.4. C++ random

```
mt19937
rng(chrono::steady_clock::now().time_since_epoch().count());
```

## 2. Algebra

$$\sum_{i=1}^n k^2 = \frac{n(n+1)(2n+1)}{6}$$

$$\sum_{i=1}^n k^3 = \left(\frac{n(n+1)}{2}\right)^2$$

## 3. Number Theory

### 3.1. Rabin-Miller

```
using u64 = uint64_t;
using u128 = __uint128_t;

u64 binpower(u64 base, u64 e, u64 mod) {
    u64 result = 1;
    base %= mod;
    while (e) {
        if (e & 1)
            result = (u128)result * base % mod;
        base = (u128)base * base % mod;
        e >>= 1;
    }
    return result;
}

bool check_composite(u64 n, u64 a, u64 d, int s) {
    u64 x = binpower(a, d, n);
    if (x == 1 || x == n - 1)
        return false;
    for (int r = 1; r < s; r++) {
        x = (u128)x * x % n;
        if (x == n - 1)
            return false;
    }
    return true;
}

bool MillerRabin(u64 n, int iter=5) { // returns true if n is
probably prime, else returns false.
    if (n < 4)
        return n == 2 || n == 3;

    int s = 0;
    u64 d = n - 1;
    while ((d & 1) == 0) {
        d >>= 1;
        s++;
    }

    for (int i = 0; i < iter; i++) {
        int a = 2 + rand() % (n - 3);
        if (check_composite(n, a, d, s))
            return false;
    }
    return true;
}
```

### 3.2. Extended GCD

```
int gcd(int a, int b, int& x, int& y) {
    if (b == 0) {
        x = 1;
        y = 0;
        return a;
    }
    int x1, y1;
    int d = gcd(b, a % b, x1, y1);
```

```

x = y1;
y = x1 - y1 * (a / b);
return d;
}

```

### 3.3. Chinese Remainder Theorem

Notes:

- Assumes all modulo are pairwise coprime
- If not, splitting modulus using prime powers works

```

int mod_inv(int a, int mod){
    int x, y;
    int g = extGcd(a, mod, x, y);
    x = (x % mod + mod) % mod;
    return x;
}

pair<int, int> crt(vector<pair<int, int>> congruences){
    // {mod, remainder}
    int M = 1;
    for(auto c : congruences){
        M *= c.first;
    }
    int solution = 0;
    for(auto c : congruences) {
        int a_i = c.second;
        int m_i = M / c.first;
        int n_i = mod_inv(m_i, c.first);
        solution = (solution + a_i * m_i % M * n_i) % M;
    }
    return {M, solution};
}

```

### 3.4. Random usable primes

```

666240077 964865333 115091077 378347773 568491163 295451837
658540403 856004729 843998543 380557313

```

### 3.5. Euler's totient function

Useful stuff:  $a^{\phi(n)} \equiv 1 \pmod{n}$  if  $\gcd(a, n) = 1$

```

sum_{i|n} \phi(i) = n

phi[1] = 1;
for(ll i = 2; i <= n; i ++ ){
    phi[i] = i;
}
for(ll i = 2; i <= n ; i ++ ){
    if(pr[i] == false){
        for(ll j = i ; j <= n; j += i){
            phi[j] /= i;
            phi[j] *= (i - 1);
            pr[j] = true;
        }
    }
}

```

## 4. Combinatorics

### 4.1. Stars and bars

$n$  balls,  $k$  boxes:

$$\binom{n+k-1}{k-1}$$

### 4.2. Vandermonde identity (and variants)

$$\binom{m+n}{r} = \sum \binom{n}{k} \binom{m}{r-k}$$

$$\sum \binom{n}{x} \binom{m}{x} = \binom{n+m}{n}$$

## 5. Data Structures

### 5.1. Treap

```

struct Node{
    int value, cnt, pri; Node *left, *right;
    Node(int p) : value(p), cnt(1), pri(gen()), left(NULL), right(NULL) {};
};

typedef Node* pnode;
int get(pnode q){if(!q) return 0; return q->cnt;}
void update_cnt(pnode &q){
    if(!q) return; q->cnt=get(q->left)+get(q->right)+1;
}
void merge(pnode &T, pnode lef, pnode rig){
    if(!lef){T=rig;return;} if(!rig){T=lef;return;}
    if(lef->pri>rig->pri){merge(lef->right, lef->right, rig); T=lef;}
    else{merge(rig->left, lef, rig->left); T = rig;}
    update_cnt(T);
}
void split(pnode cur, pnode &lef, pnode &rig, int key){
    if(!cur){lef=rig=NULL;return;} int id=get(cur->left)+1;
    if(id<key){split(cur->right, cur->right, rig, key-id); lef=cur;}
    else {split(cur->left, lef, cur->left, key); rig = cur;}
    update_cnt(cur);
}

```

## 6. Graphs

### 6.1. k-shortest path

```

mt19937 mt(119);
template <typename T> using min_priority_queue =
priority_queue<T, vector<T>, greater<T>>;
template <typename T>
struct heap_node{
    array<heap_node*, 2> c;
    T key;
};

template <typename T>
heap_node<T>* insert(heap_node<T>* a, T new_key) {
    if(!a || new_key.first < a->key.first){
        heap_node<T>* n = new heap_node<T>;
        n->c = {a, nullptr};
        n->key = new_key;
    }
    return n;
}

```

```

    return n;
}

## 7. Algorithms

### 7.1. Kuhn's algorithm

```

// node matching indexed 1-n with 1-m
const int N = ansus;
vector<int> g[N];
int mt[N], ind[N];
bool used[N];
bool kuhn(int u)
{
    if(used[u])
        return 0;
    used[u]=1;
    for(auto v:g[u])
```

```

        if(mt[v]==-1||kuhn(mt[v]))
        {
            mt[v]=u;
            ind[u]=v;
            return 1;
        }
    }
    return 0;
}
int main()
{
    for(int i = 0;i<m;i++)
        mt[i]=-1;
    for(int i = 0;i<n;i++)
        ind[i]=-1;
    for(int run = 1;run;)
    {
        run=0;
        for(int i = 0;i<n;i++)
            used[i]=0;
        for(int i = 0;i<n;i++)
            if(ind[i]==-1&&kuhn(i))
                run=1;
    }
    // ind[u] = -1, ja nav matchots, citadi ind[u] = indekss no
    otras komponentes
}
```

## 8. Flows

### 8.1. Dinitz

```

struct FlowEdge {
    int v, u;
    ll cap, flow = 0;
    FlowEdge(int v, int u, ll cap) : v(v), u(u), cap(cap) {}};

struct Dinic {
    const long long flow_inf = 1e18;
    vector<FlowEdge> edges;
    vector<vector<int>> adj;
    int n, m = 0;
    int s, t;
    vector<int> level, ptr;
    queue<int> q;
    Dinic(int n, int s, int t) : n(n), s(s), t(t) {
        adj.resize(n);
        level.resize(n);
        ptr.resize(n);
    }
    void add_edge(int v, int u, ll cap) {
        edges.push_back(v, u, cap);
        edges.push_back(u, v, 0);
        adj[v].push_back(m);
        adj[u].push_back(m+1);
        m += 2;
    }
    bool bfs() {
        while (!q.empty()) {
```

```

            int v = q.front();
            q.pop();
            for (int id : adj[v]) {
                if (edges[id].cap - edges[id].flow < 1)
                    continue;

    return c;
}
```

## 12. Our Geometry Template

### 12.1. Point class

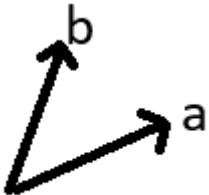

```
template<class T>
struct Point{
    T x;
    T y;
    Point operator+(const Point &o) const {
        return {x + o.x, y + o.y};
    }
    Point operator-(const Point &o) const {
        return {x - o.x, y - o.y};
    }
```

```

Point operator*(T w) const {
    return {x * w, y * w};
}
Point operator/(T w) const {
    return {x / w, y / w};
}
Point perp() const {
    return Point{-y, x}; // rotates +90 degrees
}
bool operator<(Point &o){
    if(x == o.x) return y < o.y;
    else return x < o.x;
}
T cross(Point a) const {
    return x * a.y - y * a.x;
}
T dist2() const {
    return x * x + y * y;
}
double dist() const {
    return sqrt(dist2());
}
T operator*(const Point &o) const {
    return x*o.x+y*o.y;
}
};

```

## 12.2. Cross Product

In this case  $\vec{a} \times \vec{b} = a_x \cdot b_y - a_y \cdot b_x > 0$

## 12.3. Circumcenter

```

typedef Point<double> P;

double ccRadius(const P& A, const P& B, const P& C) {
    return (B-A).dist()*(C-B).dist()*(A-C).dist()/
        abs((B-A).cross(C-A))/2;
}

P ccCenter(const P& A, const P& B, const P& C) {
    P b = C-A, c = B-A;
    return A + (b*c.dist2()-c*b.dist2()).perp()/b.cross(c)/2;
}

```

## 12.4. Line Distance

```

typedef Point<double> P;
double lineDist(const P& a, const P& b, const P& p) {
    return (double)(b-a).cross(p-a)/(b-a).dist();
}

```

## 12.5. Line Intersection

```

typedef Point<double> P;
pair<int, P> lineInter(P s1, P e1, P s2, P e2) {
    auto d = (e1 - s1).cross(e2 - s2);
    if (d == 0) // if parallel
        return {-(s1.cross(e1, s2) == 0), P(0, 0)};
    auto p = s2.cross(e1, e2), q = s2.cross(e2, s1);
    return {1, (s1 * p + e1 * q) / d};
}

```

## 12.6. Minimum-Enclosing Circle

```

typedef Point<double> P;
pair<P, double> enclose(vector<P> ps) {
    shuffle(ps.begin(), ps.end(), mt19937(time(0)));
    P o = ps[0];
    double r = 0, EPS = 1 + 1e-8;
    int sz = (int)ps.size();
    for(int i = 0 ; i < sz; i ++ ){
        if((o - ps[i]).dist() > r * EPS){
            o = ps[i], r = 0;
            for(int j = 0 ; j < i; j ++ ){
                if((o - ps[j]).dist() > r * EPS){
                    o = (ps[i] + ps[j]) / 2;
